

**PS01 outline: answers**  
**Math 126, Fall 2009**

An outline for PS01 should look something like the following.

*Relevant definitions:*

We say that an integer  $d$  **divides** an integer  $n$  if  $n = dq$  for some integer  $q$ .

We say that an integer  $p$  is **prime** if  $p > 1$  and the only (positive) divisors of  $p$  are 1 and  $p$ .

We say that  $d$  is a **common divisor** of  $a$  and  $b$  if  $d$  divides  $a$  and  $d$  divides  $b$ .

For positive integers  $a$  and  $b$ , the **greatest common divisor** of  $a$  and  $b$  is the largest integer  $d$  that is a common divisor of  $a$  and  $b$ .

A **triangular number** is a number of the form  $\frac{n(n+1)}{2}$ .

A **Pythagorean triple** is a triple  $(a, b, c)$  of natural numbers such that  $a^2 + b^2 = c^2$ .

A **primitive Pythagorean triple** is a PT  $(a, b, c)$  such that  $a$ ,  $b$ , and  $c$  have no common factors greater than 1. (I.e.,  $\gcd(a, b, c) = 1$ .)

*Outlines of individual problems:*

**1.1.** First try listing all triangular numbers  $\frac{n(n+1)}{2}$  and see which ones are perfect squares. To look for a better method, maybe think about the prime factorization of  $\frac{n(n+1)}{2}$ , and how that could give a perfect square.

**1.3.** Try listing all triples of odd numbers, starting with prime numbers:  $(3, 5, 7)$ ,  $(5, 7, 9)$ ,  $(7, 9, 11)$ ,  $(11, 13, 15)$ , etc., and look for a pattern.

**1.4.** (a,b,c) Try listing numbers of the form  $N^2 - 1$  and see if there seem to be infinitely many primes of that form. Same for  $N^2 - 2$ ,  $N^2 - 3$ ,  $N^2 - 4$ .

(d) Find a pattern from (a,b,c).

**2.2. Assume:**  $d$  divides  $m$  and  $d$  divides  $n$ . **Conclude:**  $d$  divides  $m + n$  and  $d$  divides  $m - n$ . Use definition of divides.

**2.6.** (a,b) Trial and error, using PPT formula from theorem on p. 17.

(c) Use PPT formula and solve?

**3.3.** Imitate proof in Ch. 3: **Assume:**  $(x, y)$  is a rational point on  $x^2 - y^2 = 1$ . Consider line through  $(-1, 0)$  and  $(x, y)$ , with rational slope  $m$ , solve for  $x$  in terms of  $m$ . **Conclude:**  $(x, y) = (?, ?)$  (formula involving  $m$ ).
